

Product Designer — Design Test

Time: 12 hours · **Screen:** the Job page · **Platforms:** mobile

The situation

We make software for roofing companies. The main screen is the **Job page** — where a salesperson sees everything about one customer's roof job and does their daily work: writes notes, sends emails and texts, creates tasks, and builds estimates and proposals to win the job.

A typical roof job goes through stages — a new lead, an inspection appointment, an estimate, a signed proposal, the work itself, and finally the invoice. Most jobs come from storm or hail damage, so they're tied to a homeowner's insurance claim.

The problem

The current screen feels old and confusing:

- It's not clear what to do next when you open the job.
- The most important actions — creating an estimate, proposal, or invoice — are hard to find.
- When you click something, you're not sure if it worked.
- There's a lot of empty space, but things are still hard to find.

The challenge

Redesign the Job page so it's clean, modern, and easy to use — on **both desktop and mobile**. A salesperson should open it and instantly understand what's going on, know what to do next, and be able to act fast.

Your design should cover:

- **Adding a second contact** to the job (for example, the homeowner's spouse).
- **The job's info fields** (roof type, insurance, claim number, etc.) — easy to read and edit.
- **The four main actions** — Note, Task, Email, Message — clearly placed, and what happens when you use one.
- **Clear confirmation** when something is done (a note saved, an email sent, a task created).

Important: use realistic mock data

Don't leave your screens empty or full of placeholders. **Fill the whole design with realistic sample data you create yourself** — real-sounding names, a real-looking job, notes, an estimate amount, tasks, dates, etc. The flow should feel like a real job a salesperson is working on, so we can actually judge how it reads and works.

What to deliver

1. The **redesigned Job page** — desktop and mobile.
2. **One example shown step by step** — pick something like "add a second contact" or "send a proposal" — so we can see the flow from start to finish, including how the screen confirms it worked.
3. A **short note** (a few sentences or slides) explaining your main decisions: what you changed and why.

What we're looking for

A clean design that makes the next step obvious, makes creating things easy to find, and clearly tells the user when something happened. We care about clear thinking and good decisions — not pixel-perfect polish or lots of screens.
